"Dok Ak Nauk SSSR" Vol LXXIII, No 4, pp 825-828

Studies changes in int organs and circulatory system of chicken embryo by injection of diphtheria toxin equal to 0.02-0.2 of min lethal dose for guinea pigs. Finds effect of toxin is expressed 1st on peripheral vessels, and that all changes in remaining organs occur as result of damage to circulatory system. Four figures.

Discharges in hydrogen. A. S. Pokrovskaya. Zhur. Tekh. Fiz. 21, 617-24 (1951); Chem. Ztbl. 1952, 1609. The probe (or grid) method was employed to study the pos. discharge column in H₂. The exptl. results showed complete agreement with the theory of plasma at low pressures advanced by Tongs and Langmuir (cf. C.A. 24, 3429). With the plasma in a state of equil., predominantly H₃⁺ ions rather than protons appeared to be formed by the electrons. The measurements reported are utilized also to det. the energy balance of the pos. column of the H₂ discharge.

Title : Pathogenic Effect of Bites of Mature Ticks Dermacentor Marginatus Sulz. on the Host. -- Patogennoe deystvie ukusov polovozrelykh kleshchey Dermacentor marginatus Sulz. na khozyaina.

Orig Pub : Zool. zh., 1957, 36, No. 2, 214-218.

Abstract : Feeding of 50-75 mature D. marginatus ticks on guinea pigs causes the host's death with a 30-50% loss of blood and severe change of its composition (hemoglobin and erythrocyte level is diminished to $\frac{1}{4}$ - 1/5, and leucocytes are increased 4-13 times). A lipid dystrophy, blood discharges, and other anomalies in tissues of internal organs are noted. Healing of the skin after bites is restored slowly.

TITLE: Thermocouple, Class 42, No. 172087

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 12, 1965, 89

TOPIC TAGS: thermocouple, precious metal, oxidizing medium, nickel, silicon, niobium, cobalt, manganese, carbon, magnesium, zirconium, calcium, lanthanum, cerium, boron, electrode

ABSTRACT: This Author Certificate presents a thermocouple based on precious metals and intended for use in oxidizing media. To increase its longevity at temperatures up to 1300°C, the negative electrode is made of nickel with 2.5-7.0% of silicon and 1.5-5.0% of aluminum, while the positive electrode is made of a nickel-alloy with 8-11% of chromium and 2-4% of silicon. Silicon may be fully or completely replaced by niobium. The electrode alloys may also be augmented with (singly or jointly) cobalt and manganese (up to 1%), zirconium (up to 0.2%), carbon and magnesium (up to 0.15%), calcium and lanthanum (up to 0.1%), cerium and boron (up to 0.01%).

Presence of gas bubbles in thin aluminum sheets. M. I. Zamotulin and G. N. Pokrovskaya. Metallurg 19, No 12, 114-116 (1939); Khimie & Industrija 42, 281. Refining of Al (to remove air bubbles) by means of Ar or He is very slow and unsatisfactory. N dissolves to a considerable extent in Al and can therefore not be used. Cl gives good results, but only provided the metal contains no N. The greater portion of the gas bubbles can be removed from Al by means of ZnCl₂; but in presence of sol. N its action is only slight. Best results in all cases are obtained by refining in vacuum chambers. A. P. C.

Pokrovskaya, G. N. (Engineer)

TITLE: Build-up of press tools with weld metal

SOURCE: Svarochnoye proizvodstvo, no. 6, 1965, 15-17

TOPIC TAGS: build-up sequence, press tool, press bushing, press die, carbon dioxide shielded arc, arc welding, flux welding, welding wire, bimetal bushing, powdered metal

ABSTRACT: The Kamensk-Ural'skiy Plant for the Processing of Nonferrous Metals, in collaboration with the Ural Polytechnic Institute, has developed and introduced techniques of building-up machine parts by means of carbon dioxide-shielded arc welding as well as flux welding with special reference to restoring worn press bushings and dies. These press tools are the most expensive and most rapidly wearing parts of presses, since they are subject to sharp fluctuations in temperature and extreme stresses. The plant maintains its own welding department and makes its own welding wire from powdered metal. The build-up

Card 1/2

L 53881-65

ACCESSION NR: AP5014895

6

sequence for the press bushings and dies, as well as for some 28 other machine parts which are currently regularly restored by build-up at this plant, involves the deposition of successive 3-4, 4-5, and 5-6 mm layers of weld metal. The plant has also developed new welding-wire compositions based on metal powders. Thus for example, the replacement of the bushings of a 1,500-ton press, made of 4KhNV steel, with bimetal bushings made of 30KhGSA steel with a built-up working layer of the 2Kh3V10GT/type yields savings of as much as 700 kg of nickel annually. Even greater savings of nickel are anticipated on replacing the bushings, plates, and dies of a 3,500-ton press, made of 4KhNV steel, which contains up to 4.5% nickel, with their counterparts made of 5KhNV steel, containing 1.5% nickel, and topped with a wear-and heat-resistant built-up coating. Orig. art. has: 4 figures, 5 tables.

TITLE: Electroslag melting of monel metal

SOURCE: Tsvetnye metally*, no. 9, 1964, 90-91

TOPIC TAGS: monel metal, monel metal melting, monel metal electroslag melting, electroslag melting

ABSTRACT: Since monel metal ingots produced by conventional melting methods have numerous defects such as hairline cracks, an attempt was made to obtain high-quality monel metal by electroslag melting. Tests were made with a consumable electrode 70—75mm in diameter, using AN-291 flux, with a current of 1800—2500amp and a voltage of 46 v. Ingots 150 mm in diameter were produced which had good surface quality and a dendritic structure, without any shrinkage porosity or hairline cracks. The manganese content of the ingots was 7—10% lower than that of the consumable electrodes. No loss of other components was observed. The high quality of electroslag melted monel metal appears to justify the additional expenditures and complications connected with electroslag melting. Orig. art.

TITLE: SAP made from secondary aluminum

SOURCE: Alyuminiiye splavy*. Sbornik statey, no. 2. Spechennyye splavy*. Moscow, 1963, 28-30

TOPIC TAGS: powder metallurgy, sintered aluminum, aluminum powder, sintered aluminum powder, primary aluminum, secondary aluminum, SAP

ABSTRACT: Grade A0 and A00 primary aluminum is normally used for manufacturing grade APS aluminum powder. The problem of using aluminum powder made of grade ATsV secondary aluminum (1.1% Al₂O₃; 3.1% Si; 2.88% Cu; 1.56% Zn; 1.1% Fe; 0.01% Mn; 0.03% H₂O; the rest Al, with a specific gravity of 1.15) was solved by a series of tests investigating the mechanical properties and corrosion resistance of such blanks. These tests showed that at temperatures up to 350C, the ultimate strength of SAP from secondary aluminum containing 7% Al₂O₃ (45 kg/mm² at 20C and 15 kg/mm² at 300C) is higher than that of SAP from primary aluminum. The relative elongation (4% at 20C, 6% at 300C), on the other hand, was lower than that of SAP from primary aluminum at temperatures up to 100-120C and higher at

TITLE: The Area of Oil-bearing Sands at the Samarskaya Luka
Oilfields (Ob udel'noy poverkhnosti peschanykh
kollektorov mestorozhdeniy Samarskoy Luki)

PERIODICAL: Neftyanoye khozyaystvo, 1957, Nr 7, pp 43-45 (USSR)

ABSTRACT: This study was undertaken to determine the area of oil-bearing sands in the coal and Devonian beds at the Samarskaya Luka oilfields. For the coal formation B₂ the oil-bearing sand content was determined on the basis of 50 core samples from 33 wells in the Zol'noye (Zol'nenskoye), Strel'nenskoye, Yablonovyy Ovrag, Karlovo-Sytovskoye, Gubinskoye, Syzran' (Syzranskoye) and Zaborovka (Zaborovskoye) oil fields. For the Devonian formations the sand content was determined on the basis of 47 core samples from 19 wells in the Zol'noye, Zhigulevsk (Zhigulevskoye), and Yablonovyy Ovrag oil fields. The core samples were extracted in Soxhlet apparatus. After drying, the general porosity

Card 1/2

The Area of Oil-bearing Sands (Cont.)

93-57-7-12/22

was determined by the saturation method and the absolute permeability by pressing compressed nitrogen through the sand. The results are given in Table 1. The author compares the specific areas of oil-bearing sands at Samarskaya Luka oilfields with those of the Devonian oil-bearing sands in the Tuymazy oilfield studied by L.I. Rubinshteyn of the Ufa Petroleum Scientific Research Institute (UFNII). There is one table.

TITLE:

On Testing Methods for Thermolectrodes and Thermocouples
(On the Occasion of the Paper by A. N. Gordov and N. N. Ergardt,
Published in the Periodical "Zavodskaya laboratoriya", 1958,
Vol 24, Nr 12)

II

PERIODICAL:

Zavodskaya laboratoriya, 1960, Vol 26, Nr 1, p 121 (USSR)

ABSTRACT:

A number of authors (Ref 1) investigated the stability of thermocouples by means of two methods. One method determines the variation of the thermoelectric force of the thermolectrodes depending on the temperature and the duration of the stay in the furnace. The second method determines the stability from the variation of the thermoelectric force due to different immersion depths of the thermocouple into the furnace. The authors mentioned in the title consider investigations of the variation of the thermoelectric force of the thermolectrodes at any working conditions, as examinations "of stability". They consider examinations with unchanged position of the thermocouple as "examinations of the duration of application". Contrary to the authors

On Testing Methods for Thermoelectrodes and Thermo- S/032/60/026/01/048/052
couples (On the Occasion of the Paper by A.N. Gordov B010/B001
and N. N. Ergardt Published in the Periodical
"Zavodskaya laboratoriya", 1958, Vol 24, Nr 12). II

mentioned in the title, the present authors assume that the latter examinations are to be considered criteria for the stability of the thermocouples since the majority of the thermocouples are used under stationary conditions. For this reason, only a small section of the paper by I. P. Zubov (Ref 1) (which was criticized in the paper mentioned in the title) and of the paper by Dal' (Ref 1) was devoted to the second method mentioned above. For the same reason, the stability of chromel-, alumel-, and koper wires is tested at strictly fixed position of the thermoelectrodes in the furnace at the present factory. There is 1 Soviet reference.

TITLE: Thermoelectromotive force of binary solid solutions on a Ni-base

SOURCE: Moscow. Gosudarstvennyy nauchno-issledovatel'skiy i proyektnyy
institut splavov i obrabotki tsvetnykh metallov. Trudy*, no. 22, 1964. Issledo-
vaniye splavov dlya termopar (Studying alloys for thermocouples), 39-61

TOPIC TAGS: thermoelectromotive property, binary solid solution, nickel,
aluminum, beryllium, cobalt, chromium, copper, iron, germanium, magnesium,
manganese, molybdenum, niobium, rhodium, silicon, tantalum, titanium, van-
adium, tungsten, zirconium, oxidation resistance

ABSTRACT: Many alloys used for the production of thermocouples have a Ni
base and, therefore, their thermoelectric properties are of considerable interest.
Ni alloys with Al, Be, Co, Cr, Cu, Fe, Ge, Mg, Mn, Mo, Nb, Re, Si, Ta, Ti,

4

V²⁷, W²⁷ and Zr²⁷ were tested. Specimens consisted of 300 g ingots having a diameter of 18 mm. An argon induction furnace was used and a magnesite crucible. Ingots with a low content of additives were cold-rolled into 5.3 mm rods and cold-roll specimens with a high content of the second component were subjected to intermediate quenching from 1200C. The rods were annealed for two hours at 1000C and the thermoelectromotive force measured within a temperature range of 0 to 1200C. Most tested elements enhanced the thermoelectromotive force of Ni and 15 to 17% Mo, 6.5% Co and 19 to 20% W had a conspicuous effect. Elevated temperature accelerated the effect and low temperature slowed it down considerably. The only exceptions were Al, Be and Cu: these elements lowered the thermoelectromotive force. Many systems displayed an extremum in solid solutions with Cr, Co, Al, Si, Co, etc. Orig. art. has: 36 figures and 3 tables

TITLE: Investigation of Alumel and Chromel alloys with cobalt additions

SOURCE: Moscow. Gosudarstvennyy nauchno-issledovatel'skiy i proyektnyy
institut splavov i obrabotki tsvetnykh metallov. Trudy*, no. 22, 1964. Issledovaniye
splavov dlya termopar (Studying alloys for thermocouples), 101-114

TOPIC TAGS: Chromel, Alumel, Co, Mn, Ni, Cr, oxidation resistance, thermal emf

ABSTRACT: The decline of the production of Chromel and Alumel couples in recent years initiated an investigation of the thermoelectromotive properties of these alloys with Co additions. The stability, oxidation rate and changes in the thermoelectromotive force under the effect of oxidation were observed in Ni(N-1), Cr(KhO), Si(KrI), Al(A00) and Mn(Mrl) alloy wire rods having a diameter of 3.2 mm and 1.2 mm. Co additions were found to lower the thermoelectromotive force of Chromel and Alumel, their thermoelectric properties becoming more linear and approximating the norms set by State Standards (GOST) 1790-63. (see figs. 1 &

Cord 1/8

L 23848-65
ACCESSION NR: AT4045673

2 of enclosure). Therefore, Co is a suitable regulator of the thermoelectric properties of both alloys. Oxidation resistance of Chromel and its working properties were substantially improved and those of Alumel to a lesser extent by Co additions. All specimens were endowed with improved stability and the thermoelectromotive force of couples approximated the norms set by State Standards 3044-61. Orig. art. has: 7 figures and 3 tables

AUTHOR: Nuzhnov, A. G. (Deceased); Pokrovskaya, G. N.; Puchkov, B. I.; Rogel'berg, I. L.; Tarasova, T. V.

TITLE: Investigation of the effect of the composition of an "CA" alloy on the thermoelectromotive force

SOURCE: Moscow. Gosudarstvennyy nauchno-issledovatel'skiy i proyektnyy institut splavov i obrabotki tsvetnykh metallov. Trudy*, no. 22, 1964. Issledovaniye splavov dlya termopar (Studying alloys for thermocouples), 129-142

TOPIC TAGS: aluminum, silicon, manganese, thermoelectromotive force

ABSTRACT: The effect of Si, Al and Mn on the thermoelectromotive force of the Alumel-type alloy "CA", was investigated. Unlike Alumel, the Al contents in the "CA" alloy is higher (up to 3.5%) and the Mn contents lower (less than 2%). All tests were conducted within a 100 to 1000C temperature range. All three components lowered the thermoelectromotive force of the tested alloy. The effect of Mn was found to be independent of the concentration of the two other components.

Card 1/2

L 23819-65
ACCESSION NR: AT4045875

An efficient adjustment of the electromotive force calls for the maintenance of an invariable Mn level of 1.4% during the melting of the alloy while Al and Si are added. The electromotive force rose sharply above 12 mv when Mn quantities were higher and the Si and Al contents was 1.1% and 3.3% respectively. As a rule, the Al contents in that alloy exceeds 2.8% and increasing concentrations lower the thermoelectromotive force. The lowering effect of Si is more appreciable within the 400 to 1000C range when the alloy has a high Al content. The effect of the composition on the thermoelectromotive force may serve as a basis for the production process of "CA" alloys. Orig. art. has: 12 figures and 2 tables

TITLE: Thermoelectromotive force of binary solid solutions on a cobalt base

SOURCE: Moscow. Gosudarstvennyy nauchno-issledovatel'skiy i proyektnyy institut splavov i obrabotki tsvetnykh metallov. Trudy*, no. 22, 1964. Issledovaniye splavov dlya termopar (Studying alloys for thermocouples). 62-71

TOPIC TAGS: cobalt, aluminum, beryllium, chromium, copper, iron, germanium, manganese, niobium, nickel, silicon, tantalum, titanium, vanadium, tungsten, molybdenum, zirconium, binary solid solution, thermoelectromotive force, cobalt based solution

ABSTRACT: The authors investigate the thermoelectromotive force of Co solid solutions in the quest for alloys that would be suitable for the production of thermocouples. Specimens contained up to 4% Co and Al, 1.5% Be, 25% Cr, 5% Cu,

Card 1/2

L 32262-65

ACCESSION NR: AT4045672

40% Fe, 5% Ge, 40% Mn, 5% Nb, 10% Ni, 20% Re, 5% Si, 10% Ta, 6% Ti, 15% Va, 13% W, 10% Mo and 2% Zr. Testing temperatures varied between 100 and 1200 C. The changes in the thermoelectromotive force were found to become increasingly complex as the concentration of the dissolved component was increased and that accurate observations required the measurement of the thermoelectric properties in a state of equilibrium. With heightened concentration of the solid solution, the thermoelectromotive force was observed to decline. In Co alloys having low solubility components such as Cu, Zr and Be, the increased concentration of the alloying element brought about an initial decrease and subsequently a slight increase of the thermoelectromotive force. Only Co-Cr alloys containing over 20% Cr were found suitable for the positive electrode. These alloys possess a satisfactory thermoelectromotive force and earlier investigations show them to be sufficiently oxidation-resistant. (Orig. art. has: 16 figures)

TITLE: Investigation of the effect of composition on the thermo-electromotive force of an "NK" alloy

SOURCE: Moscow. Gosudarstvennyy nauchno-issledovatel'skiy i pro-yektnyy institut splavov i obrabotki tsvetnykh metallov. Trudy*, no. 22, 1964. Issledovaniye splavov dlya termopar (Studying alloys for thermosouples), 115-128

TOPIC TAGS: alloy composition, NK alloy, Co, Mn, Al, Si, Ni, Fe, Mg, Cu, thermoelectromotive force

ABSTRACT: The investigated NK alloy contained 15 to 20% Co, approximately 2% Mn and Al, 1% Si and Ni. Serious difficulties arose in melting this alloy in industrial furnaces because of an inability to control its electromotive properties. The authors continued experiments on the basis of earlier findings. The effect of the basic components as well as of Fe, Cu and Mg was observed within the 100 to 1000 C range. Al and Si additions proved beneficial for

L 32263-65

ACCESSION NR: AT4045674

thermoelectromotive control of the specimens during melting while
the Mn and Co content was maintained on a constant level. At high
temperatures, an increase in the Co contents enhanced the thermo-
electromotive force. The suggested optimal composition is 1.8 to
2.1% Al, 0.9 to 1.1% Si, 16.5 to 17.5% Co and 1.9 to 2.1% Mn. The

Moscow, Izd-vo AN SSSR, 1960. 254 p. Errata also inserted. 3,000 copies

Ed.: M.A. Klyuyev, Academician; Ed. of Publishing House: G.S. Gorobtsov Tech.
Ed.: V.V. Brusgal

PURPOSE. The book is intended for scientists and engineers working in various
branches of science and industry concerned with thermodynamics and heat trans-
fer problems.

CONTENTS. The book consists of 19 original articles on various problems in thermo-
dynamics. The following subjects are discussed: mechanism of heat transfer
processes, laminarization of heat exchange, determination of thermophysical
properties of operating media, heat transfer in supercavitating flows of gas and
liquid, calculation of molecular reactors, theory and experimental techniques
of analysis of the experimental data obtained in given conditions, and heat transfer and
heat exchange, always taking account of

viscosity, thermal conductivity, and thermal diffusivity, investigation of heat
transfer in boiling, boiling and underboiling, investigation of heat
transfer in pipes.

PURPOSE: This collection of articles is intended for meteorologists serving with the hydrometeorological network in the Soviet Union.

COVERAGE: The publication contains scientific articles on the methods of meteorologic observations and on the procedure of testing meteorological instruments. The possibility of reducing the errors and thus securing more accurate results in observations are shown by mathematical computations and graphs. The need for a universal portable instrument that would be capable of instantly recording cloud height is emphasized. The articles are accompanied by maps, diagrams, tables and references.

TITLE: Results of an investigation of the new standard barometers

SOURCE: Leningrad. Glavnaya geofizicheskaya observatoriya. Trudy*, no. 160, 1964.
Metodika meteorologicheskikh nablyudenii i obrabotki (Methods of meteorological
observation and processing observation data), 123-131.

TOPIC TAGS: meteorology, meteorological instrument, barometer, standard barometer

ABSTRACT: The standard instruments used as reference barometers in the measurement of atmospheric pressure by the Gidrometsluzhba SSSR (Hydrometeorological Service of the SSSR) are the standard GGO barometers Nos. 1 and 2, dating back to the late 19th century. Vsesoyuznyy nauchno-issledovatel'skiy institut metrologii (All-Union Scientific Research Institute of Metrology) fabricated two new standard barometers (Nos. 3 and 4). The new standard barometers ensure a higher accuracy in the measurement of atmospheric pressure. This increase in accuracy is attained by an improved method for measurement of the mercury level differences in the barometer and greater accuracy in the measurement of barometer temperature. Both the old and new barometers are virtually free of errors associated with the influence of capillary forces on the mercury level.

ACCESSION NR: AT4044402

This article describes precise comparisons of standard barometers Nos. 3 and 4 with one another and with standard barometers Nos. 1 and 2. The characteristics of barometers Nos. 1 and 2 are given, since the only other descriptions are in very old references (H. Wild, Meteorologicheskly sbornik, Vol. I, 1874 and Repertorium fuer Meteorologie, Bd. XVI, No. 4, 1892). Standard barometers Nos. 3 and 4 are completely identical and of stainless steel; a description is given but no photographs or diagrams. Particular attention is given to the procedure by which the mercury level is determined. The problem of vibration of the free surface of the mercury column is discussed; all comparisons were made at night when urban traffic was lightest and only under stable atmospheric conditions. During 1961-1962 a total of 32 series of comparisons was made between the two new barometers, usually with one of the two older barometers used as a control. The mean difference (0.03 mm) in the readings of the new standard barometers and barometer No. 1 indicates that use of the new instruments will have virtually no effect on the corrections for barometers used in checking pressure instruments. At present, the mean square error of one barometer reading is 0.014 mm Hg. The barometers are not yet on their permanent mountings and will have to be investigated again after they are set up in permanent positions. Orig. art. has: 1 formula and 3 tables.
